

# Linux User/s Creation using BASH Script

---

## Prerequisites :

- Setup password less login for your Linux ID between Bastion(JumPHost) and Target(client) servers.
- Enable 'NOPASSWD' for your Linux ID in Target sudoers file(Generally, this will be done upon your onboarding process as part of access request).

**Create a server\_list and user\_list files under your home diretory where you placed script.**

- **server\_list** contains server name/s or IP/s if no dns resolve, as follows

---

**server1 or IP**

**server2 or IP**

- **user\_list** contains user details like as follows

---

**user1:group:secodary group:comment: ssh key or blank if no key**

but should be end with :

Ex: NO KEY

**user1:group:secondary group(if given else empty):comment:**

**user2:group:secondary group:comment:**

EX: With KEY

**user1:group:secondary group(if given else empty):comment:place here ssh key**

- Script to be run from your Bastion(JumpHost).

~ chmod +x user\_add.sh

~ ./user\_add.sh server\_list user\_list

**Just have a look of output files, will see new user details whether success or failed error messages**
